[Geoengineering Watch](#) will start to release as of yet unseen footage from the filming of The Dimming, this is the first installment. Aluminum nanoparticle fallout from climate engineering operations are building up in our snow, soils and runoff waters, the levels are far beyond alarming. Lab test results of snow from the side of Northern California's Mt. Shasta are a truly shocking example. Testing samples from this formerly pristine water source have revealed levels of aluminum that are so astronomically high that the meltwater can only be considered completely contaminated. This 7 minute video contains important [GeoengineeringWatch.org](#) footage. The testimony revealed in this video is from a highly degreed former USFS government scientist, it serves as a sobering wake up call and warning for us all.
