

# Ebola: Shattering the Lies and the Fakery

## [Ebola: Shattering the Lies and the Fakery](#)

*Once again, the virus is the cover story*

by [Jon Rappoport](#), [No More Fake News](#)

January 12, 2022

We're warned, now and then, that a new Ebola outbreak might be spreading. It's one of those Coming Attractions in the theater that shows one virus movie after another.

In this case, the fear-hook is the bleeding symptom. It makes people cower in the dark. O my God, look at the BLOOD. It's...THE VIRUS."

Yahoo News, 2/26/21 [1]: "...the World Health Organization reported a cluster of Ebola cases in Guinea...The Biden administration is moving forward with plans to screen airline passengers from two African countries arriving in the U.S. for Ebola..."

Because I do the work others won't do...and because I covered the Ebola story in 2017 and 2014, here are essential quotes from my pieces during that period—

There is one predictable outcome: at Congo clinics and hospitals, frightened people who arrive with what are labeled "early signs" of Ebola will be diagnosed as probable cases. What are those symptoms? Fever, chill, sore throat, cough, headache, joint pain. Sound familiar? Normally, this would just be called the flu.

The massive campaign to make people believe the Ebola virus

can attack at any moment, after the slightest contact, is quite a success.

People are falling all over themselves to raise the level of hysteria.

And that is preventing a hard look at Liberia, Sierra Leone, and the Republic of Guinea, three African nations where poverty and illness are staples of everyday life for the overwhelming number of people.

The command structure in those areas has a single dictum: don't solve the human problem.

Don't clean up the contaminated water supplies, don't return stolen land to the people so they can thrive and grow food and finally achieve nutritional health, don't solve overcrowding, don't install basic sanitation, don't strengthen immune systems, don't let the people have power—because then they would throw off the local and global corporate juggernauts that are sucking the land of all its resources.

In order not to solve the problems of the people, a cover story is necessary. A cover story that exonerates the power structure.

A cover story like a virus.

It's all about the virus. The demon. The strange attacker.

Forget everything else. The virus is the single enemy.

Forget the fact, for example, that a recent study of 15 pharmacies and 5 hospital drug dispensaries in Sierra Leone discovered the widespread and unconscionable use of beta-lactam antibiotics.

These drugs are highly toxic. One of their effects? Excessive bleeding.

Which just happens to be the scary “Ebola effect” that’s being trumpeted in the world press.

(J Clin Microbiol, July 2013, 51(7), 2435-2438), and Annals of Internal Medicine Dec. 1986, “Potential for bleeding with the new beta-lactam antibiotics”)

Forget the fact that pesticide companies are notorious for shipping banned toxic pesticides to Africa. One effect of the chemicals? Bleeding.

Forget that. It’s all about the virus and nothing but the virus.

Forget the fact that, for decades, one of the leading causes of death in the Third World has been uncontrolled diarrhea. Electrolytes are drained from the body, and the adult or the baby dies. (Diarrhea is also listed as an “Ebola” symptom.)

Any sane doctor would make it his first order of business to replace electrolytes with simple supplementation—but no, the standard medical line goes this way:

The diarrhea is caused by germs in the intestinal tract, so we must pile on massive amounts of antibiotics to kill the germs.

The drugs kill off all bacteria in the gut, including the necessary and beneficial ones, and the patient can’t absorb what little food he has access to, and he dies.

Along the way, he can also bleed.

But no, all the bleeding comes from Ebola. It’s the virus. Don’t think about anything else.

Forget the fact that adenovirus vaccines, which have been used in Liberia, Guinea, and Liberia (the epicenter of Ebola), have, according to [vaccines.gov](http://vaccines.gov), the following adverse effects: blood in the urine or stool, and diarrhea.

Reporter Charles Yates uncovered a scandal in Liberia centering around the Firestone Rubber Plantation—chemical dumping, poisoned water.

And skin disease.

“Rash” is listed as one of the Ebola symptoms.

Then there is the Liberia Coca Cola bottling plant: foul black liquid seeping into the environment—animals dying.

Chronic malnutrition and starvation—conditions that are endemic in Liberia, Sierra Leone, and Guinea—are the number-one cause of T-cell depletion (aka immune system suppression) in the world.

Getting the picture?

In email correspondence with me, David Rasnick, PhD, announced this shocking finding:

“I have examined in detail the literature on isolation and Ems [EM: electron microscope pictures] of both Ebola and Marburg viruses. I have not found any convincing evidence that Ebola virus (and for that matter Marburg) has been isolated from humans. There is certainly no confirmatory evidence of human isolation.”

In other words, there is no evidence that the Ebola virus actually exists.

Rasnick obtained his PhD from the Georgia Institute of Technology, and spent 25 years working with proteases (a class of enzymes) and protease inhibitors. He is the author of the book, *The Chromosomal Imbalance Theory of Cancer*. He was a member of the Presidential AIDS Advisory Panel of South Africa.

The real reasons for the “Ebola outbreak” include, but are not limited to: industrial pollution; organophosphate pesticides

(causes bleeding); vast overuse of antibiotics (causes bleeding); severe and debilitating nutritional deficiencies (which can cause bleeding); starvation; drastic electrolyte loss; chronic diarrhea; grinding poverty; war; stolen farm land; vaccination campaigns (in people whose immune systems are compromised, vaccines can easily wipe out their last shreds of health).

What about doctors and nurses in West Africa, who are treating Ebola patients? These health workers are falling ill with “the dreaded disease.”

Are they?

They’re working in very high temperatures, in clinic rooms likely sprayed with extremely toxic organophosphate pesticides. They’re sealed into hazmat suits, where temperatures rise even higher, causing the loss of up to five liters of body fluid during a one-hour shift. Then, recovering, they need IV rehydration, and they are doused with toxic disinfectant chemicals. They go back into the suits for another round of duty. One doctor reported that, inside his suit, there was (toxic) chlorine. These factors alone could cause dangerous illness and even death, and, of course, the basic symptoms of “Ebola.”

The experts were expressing grave doubts about Ebola, all the way back in 1977. Right at the beginning of the hysteria.

The 1977 reference here is: “Ebola Virus Haemorrhagic Fever: Proceedings of an International Colloquium on Ebola Virus Infection and Other Haemorrhagic Fevers held in Antwerp, Belgium, 6-8 December, 1977.”

This report is 280 pages long. It’s well worth reading and studying, to see how the experts hem and haw, hedge their bets, and yet make damaging admissions:

For example, “It is impossible to consider the virological

diagnosis of Ebola virus infection loose [apart] from the diagnosis of haemorrhagic fevers in general. The clinical picture of the disease indeed is too nonspecific to allow any hypothesis as to which virus may be responsible for any given case.”

Boom.

To those who point out there is a history of hemorrhagic (bleeding) fevers in parts of Africa, there is a history of horrendous malnutrition, one aspect of which is scurvy, which causes bleeding from all mucous membranes.

Bottom line: no need for a virus to explain the bleeding.

Then we have pesticides.

The reference here is “Measuring pesticide ecological and health risks in West African agriculture...” Feb. 17, 2014, published in Philosophical Transactions of The Royal Society, by PC Jepson et al.

“The survey was conducted at 19 locations in five countries and obtained information from 1704 individuals who grew 22 different crops. Over the 2 years of surveying, farmers reported use of 31 pesticides...

“...certain compounds represented high risk in multiple environmental and human health compartments, including carbofuran, chlorpyrifos, dimethoate, endosulfan and methamidophos.

“Health effects included cholinesterase inhibition, developmental toxicity, impairment of thyroid function and depressed red blood cell count...”

The study also notes that “[p]esticide imports to West Africa grew at an estimated 19% a year in the 1990s...well ahead of the growth in agricultural production of 2.5%...” In other words, pesticides have flooded West Africa.

Here is another vital observation made in the study: "The distribution and sale of pesticides in West Africa is not effectively regulated. Multiple channels of supply commonly include the repackaging of obsolete or illegal stocks [extremely toxic] and the correspondence between the contents of containers to what is stated on the label is poor..."

Pesticide suppliers conceal banned pesticides—which they are taking a loss on, because they can't sell them—and put them inside containers labeled with the names of legal pesticide

Let's consider the pesticides specifically mentioned in the study.

Carbofuran—According to the New Jersey Dept. of Health and Senior Services' Hazardous Substance Fact Sheet, exposure to Carbofuran "can cause weakness, sweating, nausea and vomiting, abdominal pain, and blurred vision. Higher levels can cause muscle twitching, loss of coordination, and may cause breathing to stop [imminent death]."

Chloropyrifos, dimethoate, and methamidophos are organophosphates. The Pesticide Action Network describes organophosphates as "among the most acutely toxic of all pesticides...they deactivate an enzyme, Cholinesterase, which is essential for healthy nerve function."

Endosulfan is being phased out globally, because it is extremely toxic and disrupts the endocrine system.

These pesticides can and do produce a number of the symptoms called "Ebola:"

Bleeding, nausea, vomiting, diarrhea, rash, stomach pain, coma.

But all this is swept aside in the hysteria about The Virus.

Here is a quote from a study, "Potential for bleeding with the new beta-lactam antibiotics," Ann Intern Med December 1986;

105(6):924-31:

“Several new beta-lactam antibiotics impair normal hemostasis [body processes that stop bleeding]... These antibiotics often cause the template bleeding time to be markedly prolonged (greater than 20 minutes)... dangerous bleeding due to impaired platelet aggregation requires treatment with platelet concentrates.”

Here is a summary from MedlinePlus:

“The *Clostridium difficile* bacteria normally lives in the intestine. However, too much of these bacteria may grow when you take antibiotics. The bacteria give off a strong toxin that causes inflammation and bleeding in the lining of the colon...Any antibiotic can cause this condition. The drugs responsible for the problem most of the time are ampicillin, clindamycin, fluoroquinolones, and cephalosporins...”

So let’s look at the level of antibiotic use in West Africa and the Third World.

Voice of America, February 26, 2014, “...antibiotics have become the automatic choice for treating a child with a fever.”

AAPS (American Association of Pharmaceutical Scientists): “For instance, in most areas of West Africa, antibiotics are commonly sold as over-the-counter medications.”

TWN (Third World Network): “...a survey carried out in 1999 showed that nearly one out of two antidiarrheal products in Third World countries contained an unnecessary antibiotic...” [and chronic diarrhea in the Third World is a leading cause of death, so you can be sure that these antidiarrheal drugs are consumed in great quantities].

“...75 products (including some antibiotics) which had been pulled out or banned in one or more European countries were identified in the Third World in 1991.”

Of course, banned antibiotics would be exceptionally toxic.

In West Africa, antibiotic use is sky-high...and antibiotics do cause bleeding.

Bleeding where? In the digestive tract.

In light of that, consider the following excerpt from the healthgrades.com article, "What is vomiting blood?"

"Vomiting blood indicates the presence of bleeding in the digestive tract...

"Vomiting blood may be caused by many different conditions, and the severity varies among individuals. The material vomited may be bright red or it may be dark colored like coffee grounds..."

Yes, it turns out that any source of internal bleeding in the digestive tract—such as overuse of antibiotics—can cause a person to vomit blood.

"The uniqueness" of "Ebola-blood-vomiting" is a fairy tale.

What else could cause the "Ebola" bleeding symptom in West Africa?

We have the fact that organophosphate insecticides are being widely used for indoor spraying, in West African homes and, surely, in clinics, to kill mosquitos. One study reports: "With high DDT resistance present throughout much of West Africa, carbamates and organophosphates are increasingly important alternatives to pyrethroids for indoor residual spraying (IRS)."

Among the effects, from severe exposure to organophosphates: diarrhea, tremors, staggering gait, blood disorders, death—all of which have been described in reference to Ebola.

And then there is this: "In nine patients suffering from

organophosphate intoxication, platelet function and blood coagulation parameters were investigated...In five of nine patients a marked bleeding tendency was observed. The bleeding tendency in organophosphate intoxication is probably mainly caused by the defective platelet function." (Klin Wochenschr, Sept. 3, 1984;62 (17):814-20, author: m. Ziemann)

Bleeding. Not from a virus.

What about vaccines? A number of vaccination campaigns have been carried out in West Africa. I have found no in-depth independent investigations of the ingredients in these vaccines. But for example, a simple flu vaccine, Fluvirin, carries the risk of "hemorrhage."

Several other routine vaccines can cause vomiting. The Hib, for example.

We have this chilling report—From the (Liberian) Daily Observer, Oct. 14, "Breaking: Formaldehyde in Water Allegedly Causing Ebola-like symptoms":

"A man in Schieffelin, a community located in Margibi County on the Robertsfield Highway, has been arrested for attempting to put formaldehyde into a well used by the community."

"Reports say around 10 a.m., he approached the well with powder in a bottle. Mobbed by the community, he confessed that he had been paid to put formaldehyde into the well, and that he was not the only one. He reportedly told community dwellers, 'We are many.' There are agents in Harbel, Dolostown, Cotton Tree and other communities around the country, he said."

"State radio, ELBC, reports that least 10 people in the Dolostown community have died after drinking water from poisoned wells."

The ATSDR (US Agency for Toxic Substances and Disease

Registry) in its Guidelines for medical management of formaldehyde poisoning, lists these symptoms: "nausea, vomiting, pain, bleeding, CNS depression, coma..."

There are other sources of poisoning in West Africa. Their components and effects need further investigation.

For example: Firestone.

For nearly a century, the company has run a giant rubber plantation in Liberia. According to one estimate, Firestone controls 10% of the arable land in the country.

Aside from the wretched living and working conditions of the locals, who tap the trees for rubber, and bring their young children to work in order to meet Firestone daily quotas, there is the issue of massive pollution.

From irinnews: "LIBERIA: Community demands answers on rubber pollution":

"MONROVIA, 4 June 2009 (IRIN) – People living next to Firestone Natural Rubber Company's plantation in Harbel, 45km outside of Liberia's capital Monrovia, say pollution from the concession is destroying their health, ruining their livelihoods and even killing residents."

"Firestone's Liberia rubber concession is the second largest rubber producer in Africa and employs some 14,000 Liberians."

"Residents of the town of Kpanyarh, just next to Firestone's rubber plantation in Harbel, say the creek from which they fish and drink their water in the dry season has been contaminated with toxins."

"'We used to fish and drink the water,' 67-year-old Kpanyarh resident John Powell told IRIN on a visit to the creek which runs just outside the town. He said the water became toxic in October 2008. 'We can't drink it any longer. Some of our people have already died from this. We have drawn Firestone's

attention to our plight but they have ignored it.”

“In mid-May on an IRIN visit to the area, acidic fumes emanating from the creek caused people’s eyes to water and made it difficult to breathe.”

From BBC News: “The three-month investigation found that a plant south-east of the capital Monrovia was responsible for high [toxic] levels of orthophosphate in creeks.”

From laborrights.org: Because of lack of drinkable water on the plantation, “this situation leaves tappers and other unskilled employees and their families with no option but to drink from shallow wells and creeks.”

And of course, those creeks are heavily polluted.

Who knows how many and what toxic chemicals have been released from the Firestone plantation into the surrounding creeks and rivers?

A further investigation in West Africa could well turn up even more reasons for bleeding—none of which has anything to do with a virus. The region is rife with industrial operations which produce major pollutants—mining, offshore oil exploration and drilling, rubber-tapping, etc.

Then we come to the frightening press stories about the “Ebola-stricken, collapsing” doctors and health workers, who are treating patients in the Ebola clinics in West Africa.

These health workers have been wearing hazmat suits. Sealed off from the outside world, working shifts inside those boiling suits, where they are losing 5 quarts of body fluid an hour, they come out for rehydration, douse themselves with toxic chemicals to disinfect, and then go back in again.

One doctor told the Daily Mail he could smell intense fumes of chlorine while he was working in his suit. That means the toxic chemical was actually in there with him.

No wonder some health workers are collapsing and dying. No virus necessary.

From the Daily Mail, August 5, 2014, an article headlined, "In boiling hot suits...":

"Doctor Hannah Spencer revealed how she wills herself to feel safe inside a boiling hot air-sealed Hazmat suit..."

"Boiling: Doctors and nurses lose up to five litres in sweat during an hour-long shift in the suits and have to spend two hours rehydrating after..."

"To minimise the risk of infection they have to wear thick rubber boots that come up to their knees, an impermeable body suit, gloves, a face mask, a hood and goggles to ensure no air at all can touch their skin."

"Dr. Spencer, 27, and her colleagues lose up to five litres of sweat during a shift treating victims and have to spend two hours rehydrating afterwards."

"At their camp they go through multiple decontaminations which includes spraying chlorine on their shoes."

"Dr. Spencer: 'We would like to keep a [patient] visit between 45 minutes and one hour, but now, we're stretching it to almost two hours. We put ourselves through a very strong physiological stress when we're using personal protection gear.'"

"'We sweat, we're losing water; we're getting hotter and it wreaks havoc on the body. Our own endurance starts to wear down.'"

In another Daily Mail article ("What's shocking is how Ebola patients look before they die..."), Dr. Oliver Johnson describes working in protective gear: "The heat of the suits is quickly overwhelming, as your goggles steam up and you feel the sweat dripping underneath. And the smell of chlorine is intense."

Getting the picture? Imagine losing five quarts of water from your body in an hour. While you're trapped inside a bulky hazmat suit. While you're treating a patient who, for example, might want to escape the clinic because he's afraid of you and your Western medicine.

Imagine needing two hours after you climb out of your suit to rehydrate. Then you go back for more. Of course you also decontaminate yourself with toxic chemicals, including chlorine.

But this has absolutely nothing to do with why you might fall ill. No. If you fall ill, or collapse, or suddenly die, it's Ebola. The virus.

Sure it is.

No need to wonder. Don't ask questions. Believe the World Health Organization and the Centers for Disease Control. They always tell the truth.

—end of excerpts from my 2014 and 2017 Ebola articles—

Coda: Canadian investigator, Christine Massey, has been doing stunning work filing Freedom of Information Act requests for proof that various viruses have ever been isolated and purified (aka discovered). On March 15, 2021, she received a response from the CDC regarding the Ebola virus [2]. The CDC informed her they could find no records indicating the virus had ever been isolated and purified, from a patient sample.

Massey and her colleagues have filed seven other FOIA requests to various government agencies—seeking proof the Ebola virus has ever been isolated and purified—and the answer has always been the same: no such records exist.

Aside from exposing the horrendous truth about “Ebola” and what has really been happening in West Africa, I have another reason for writing this piece. I strongly recommend this

method of investigation to independent researchers.

You start with the supposed medical cause of illness and death. You examine that cause and see whether it actually exists. At the same time, you carry out a parallel deep dive, in order to find out whether non-viral causes explain the symptoms of illness and death.

This is all aimed at “uncovering the cover story” that is being promoted to hide the crimes of corporations and governments.

In 1987, while I was writing my first book, *AIDS INC.*, I probed a large amount of data and found my way into this approach. It worked then, and in succeeding years, it's worked time and time again.

As I never tire saying: “the virus” is the greatest cover story ever invented.
