Doctors and journalists all over the world are creating panic over the fungal infections currently alleged to be affecting people in India.

It is claimed by some that the fungal infections are a new symptom of covid-19.

Others say the fungal infections are caused by the over-prescribing of steroids for covid-19.

And yet more blame diabetes mellitus.

Both of these may contribute to the fungal problem but I do not believe they are the sole or even the main cause.

I believe this is yet more scare mongering designed to encourage people to accept one of the experimental pseudo-vaccines.

The alleged epidemic of fungal infections is caused by mask wearing. The problem is particularly prevalent in India where poor people cannot afford to buy new masks on a regular basis, thus the same mask is being worn again and again. Also, the hot weather, which increases sweating, exacerbates fungal infections in those wearing face masks.

I warned that this would happen nine months ago.

Fungi love dark, moist areas. That's why fungi can grow in

damp houses – particularly in bathrooms. Fungal infections grow in skin folds where there is little light but a good deal of moisture. Mushrooms grow in moist areas.

There are millions of types of fungi and more than one type can grow on the skin. When a mask is worn for more than two hours or so there is a huge risk that fungal growths will develop and will affect the skin, the nose, the mouth and the lungs.

The authorities don't like to admit it but the fungal infections now affecting so many people are caused by the masks they are wearing. And, of course, masks are damaging immune systems – which increases susceptibility to all types of infection (bacterial and fungal in particular). Added to this, lockdowns and the covid 'vaccine' may also damage the immune system, leaving people susceptible to fungal infections and complications caused by fungal infections.

Here are relevant short extracts from my book Proof that Masks Do More Harm than Good:

- 1) Many people wear the same mask for more than two hours (which is dangerous), wear disposable masks more than once (which is dangerous), fail to wash cloth masks (which means they accumulate bacteria, fungi and viruses – all of which are breathed in) touch their mask while it is in position (which makes the mask even worse than useless), put masks into their pockets or handbags and then put them back on creased and grubby (a very dangerous thing to do since the wearer will then be breathing in whatever bugs have been transmitted to the mask.)

- 2) Leading German virologist Professor Streeck has criticised the use of masks, which he has said are a wonderful breeding ground for bacteria and fungi.

- 3) 'I'm seeing patients that have facial rashes, fungal infections, bacterial infections,' said Dr James Meehan.

'Reports coming from my colleagues all over the world, are suggesting that the bacterial pneumonias are on the rise. Why might that be? Because untrained members of the public are wearing medical masks, repeatedly in a non-sterile fashion. They're becoming contaminated. They're pulling them off their car seat, off the rear-view mirror, out of their pocket, from their countertop, and they're reapplying a mask that should be worn fresh and sterile every single time.'

The solution is simple. Persuade people to remove their masks.
