Life emits light.

There is even proof our eyes emit light.

To a physicist this is possible since all receivers are also transmitters—a radio antenna can send or receive the same signal. The rhodopsin molecules in the retinal cells absorb and emit the same visible light.

Michael Clarage, PhD, Astrophysicist and Lead Scientist of SAFIRE, explains how we could not have organic life without cells, chemicals, light, electricity, or the ecosystems of the Earth and Sun—all levels of the hierarchy communicate and exchange energy.
