Murdering Millions of Newborn Calves for Vaccines and Other Medical Research

cc: Vegan Hollywood Celebrities and Animal Rights Advocates Who Are Taking the Covid Vaccine

October 28, 2021

In my recent series of articles on the murder of aborted live human infants for vaccine research, I made no mention of animal research.

Now I will.

The product is called Fetal Bovine Serum (FBS). It is used all over the world.

How is it obtained?

Slate News: "FBS, as the name implies, is a byproduct made from the blood of cow fetuses. If a cow coming for slaughter happens to be pregnant, the cow is slaughtered and bled, and then the fetus is removed from its mother and brought into a blood collection room. The fetus, which remains alive during the following process to ensure blood quality, has a needle inserted into its heart. Its blood is then drained until the fetus dies, a death that usually takes about five minutes. This blood is then refined, and the resulting extract is FBS. Millions of fetuses are slaughtered this way."

Think about that.

–Medical research, vaccine research, and a blood-soaked landscape. The murder of living human infants for their tissue; the murder of newborn calves for their tissue.

Slate: “FBS is also special because it is a universal growth medium. You can take almost any cell type, toss it into a petri dish with FBS, and the cells will grow. The use of the serum is extensive, with FBS being cited in more than 10,000 research papers...”

Was FBS used in the development of COVID vaccines? Yes and no statements proliferate.

However, if you take the research and development back far enough into the virology lab, the answer would be an unqualified yes.

Cell cultures in dishes are starting points for all vaccines. Virologists believe they are isolating viruses in those dishes. The purported viruses are the reasons, in the first place, for all vaccines—including COVID.

Those cell cultures in dishes need a substance that promotes the growth of the cells. Enter Fetal Bovine Serum as that substance.

In medical literature and news media, you’ll find many euphemisms and generalities that obscure the murdering of newborn calves. Animal-derived products; serum; organisms in development; growth factor; universal medium; humane treatment.

“Don’t tell the children.” In this case, everyone is supposed to be a child kept in ignorance.

And medical murder is supposed to be a special scientific procedure. Separate, remote, sanitized.

It is—until people find out what’s actually going on.

The devil is in the details.
