December 5, 2021

- Document released by Pfizer apparently as a result of a Freedom Of Information court order in the USA reveals a vast array of previously unknown vaccine adverse effects compiled from official sources around the world.
- Pfizer concedes this is 'a large increase' in adverse event reports and that even this huge volume is under reported.
- Over 100+ diseases are listed, many very serious.
- This document was compiled by Pfizer in the very early days of the vaccine rollout in NZ but was possibly not supplied to our government.
- We examine the implications for government.

Up until now, New Zealand GPs and hospitals have been provided with a fact sheet from Pfizer [listing 21 possible adverse events as a result of vaccination](#).

All of these are minor, requiring little or no treatment other than rest, with the exception of severe allergic reactions, myocarditis and pericarditis (inflammation of the heart). As a result, most of the many thousands of New Zealanders reporting adverse effects post vaccination have been sent home with

little more than advice to take an aspirin and rest. Some have been told that their conditions may be unrelated medical events, psychosomatic, or due to anxiety on their part.

Relying on the short official Pfizer fact sheet as a guide, Medsafe, our NZ medicines regulatory body, has only accepted one out of the 100+ deaths actually reported to them as related to vaccination. Most are listed as unrelated, under investigation, or unknowable. By contrast, the NZ Health Forum and other groups have collected unofficial reports of adverse effects and death proximate to vaccination. Out of 670+ reports of death compiled by the Forum, 270 have already been investigated by medical professionals and closely linked to known adverse effects. Following the publication of the new Pfizer document many more are expected to be connected with vaccination. Reports describe symptoms such as chest pain, brain fog, extreme fatigue, neurological symptoms, tachycardia, stroke, heart attacks, and many more. Collected data suggests that as many as two-thirds of adverse event enquiries made to medical staff by vaccine recipients have not been reported to CARM—the NZ system of adverse event reporting. Medsafe itself estimates in its Guide to Adverse Reaction Reporting that in NZ only 5% of adverse events are reported. As a result the NZ public is completely unaware of the extent of reported possible risks of vaccination.

The just released Pfizer document which is being circulated widely in the public domain and can be downloaded from websites is entitled:

5.3.6 CUMULATIVE ANALYSIS OF POST-AUTHORIZATION ADVERSE EVENT REPORTS OF PF-07302048 (BNT162B2) RECEIVED THROUGH 28-FEB-2021

Therefore the reported side effects predate the vaccine rollout in New Zealand. The report itself was finalised by Pfizer on 30 April 2021. Did Pfizer supply this information to our government during the early days of our universal vaccination programme? If so the results should have been

shared with our medical professionals, politicians, and the public. Many of the new 100+ listed new adverse event types now released by Pfizer in this 38 page document pose long term risks to health. Until very recently, the document was being withheld by Pfizer who maintained it should be kept confidential. There is a strong possibility that very large numbers of New Zealanders will suffer long term injury as a result.

How did this happen without anyone's knowledge?

Even though the Pfizer vaccine had undergone very short trials and had provisional approval only, Medsafe did not update its CARM adverse event reporting system to make it mandatory rather than voluntary.

Medsafe did not advise GPs and Hospital staff to be on high alert for adverse events and report them rapidly and in detail.

The Government ignored the unprecedented numbers of adverse events being reported to Medsafe and circulating in the community and on social media.

The Government instituted a public relations, promotional, and media campaign advising the public that the Pfizer covid-19 mRNA vaccine was completely safe and free of serious side effects, giving the impression that there were no side effects—not even the known serious effects of heart inflammation that Pfizer had already admitted.

Unaccountably, conditions imposed by the contract that our Government signed with Pfizer for the supply of vaccines have not been made public. We suspect that the contract contains standard clauses similar to those used with drugs that have completed safety trials, such as a provision that public discussion of adverse events may only be undertaken in conjunction with the company supplying the drug. If this is the case, it will have hamstrung Medsafe and our Government in

their approach to assessment and public discussion of adverse events.

What are the new risks of vaccination?

Anyone reading the new Pfizer adverse event report compilation will be staggered. The sheer density of the technical medical terms and disease names are nevertheless broken down into recognisable and serious categories of illness—kidney failure, stroke, cardiac events, pregnancy complications, inflammation, neurological disease, autoimmune failure, paralysis, liver failure, blood disorders, skin disease, musculoskeletal problems, arthritis, respiratory disease, DVT, blood clots, vascular disease, haemorrhage, loss of sight, Bell's palsy, and epilepsy.

How has this affected New Zealand?

Whilst even the official Medsafe record of adverse effects and the unofficial lists show that the immediate risks of covid vaccination could be as much as 50 – 300 times greater than even the most risky of previous traditional vaccines (such as the smallpox jab), and whilst the long term effects are unknown, 90% of eligible New Zealanders have gone ahead with vaccination having accepted the assurances of safety and efficacy from the government, or having been forced to get vaccinated under threat of loss of employment and freedom of movement. Feeling the fear of covid that has been generated by reports in the international and local media, most people completing vaccination heaved a great sigh of relief—that is one huge worry off my mind, now I can get on with my life.

Those finding that no immediate insurmountable reaction had surfaced (the majority) understandably agreed with the government: “What is all the fuss about? Why shouldn't everyone do this, or be made to do this? It is a social good that will protect everyone”

BUT there is a huge iceberg in the path of the good ship New

Zealand hidden under the waves of relief. Thousands are quietly suffering debilitating illness, unacknowledged and in some cases untreated by their doctors. For those who survived vaccination without immediate injury this was not a problem because they didn't know about it apart from one or two complaints from friends that might just be random coincidences.

This has brought about a division in New Zealand society which the government created in the name of public safety. Thousands of dedicated servants of the nation including teachers, health workers, and others are being stigmatised and forced out of their jobs in a manner horrifyingly reminiscent of the treatment of Jews in Nazi Germany. The government did this despite knowing that the Pfizer vaccine was neither fully tested, safe, nor particularly effective. Judges handed down decisions in courts supporting the government mandates unaware of crucial mRNA vaccine safety data, all because Pfizer had withheld this information, and the government had not done its due diligence. Had the true position been known, the High Court's NZ Bill of Rights analysis may well have been different and its provision which guarantees that every individual should be able to make their own medical choices might still be intact.

Pfizer's conclusions

Pfizer concludes the released document with a statement "Review of the available data for this cumulative PM experience, confirms a favorable benefit:risk balance for BNT162b2." PM stands for the Post Marketing data set they are evaluating of 42,086 reported adverse events. Pfizer makes this bald claim of benefit despite admitting that "the magnitude of underreporting is unknown". This document contains no further substantive information in support of this claim of benefit:risk balance other than a mysterious reference to "the known safety profile of the vaccine".

The benefit:risk argument is in essence saying: covid-19 is a serious illness and our calculations show that more people will be injured by the disease than are being injured by the vaccine, therefore there will be a net benefit. This argument falls over because of at least three very important factors: Firstly treatment options have improved and thereby the risk of serious illness and death from covid has been greatly reduced.

Secondly the risk of covid is not evenly spread. People with comorbidities (other conditions) and the elderly are at very high risk. Most other people are at very low risk. Thus vaccination could subject people at low risk from covid to a higher risk from vaccination. Approaches to preventive health education can reduce the covid risk to people with comorbidities more than vaccination can. For example a study published in the BMJ found that people following a plant based diet have a 73% reduced risk of serious illness. Data from the UK Biobank has been analysed by researchers from Manchester and Oxford Universities and the West Indies who found that shift workers (who typically have disrupted bioclocks) have three times the risk of being hospitalised with covid. Preventive remedies include changes in diet such as the introduction of more fresh fruit, vegetables, and fibre, and reductions in known unhealthy habits such as smoking, excess alcohol consumption, an overly sedentary lifestyle, a predominance of ultra processed foods, and many more.

The third and most significant reason the benefit:risk argument falls over is the sheer range of adverse reaction types observed by Pfizer and kept hidden until now.
