

The Composition of Human Life

by [Jon Rappoport](#)

I'm going to give you the shorthand version of this. We're looking at three tiers:

Consciousness.

Imagination.

Energy.

Consciousness deploys imagination, and imagination creates, among other things, energy.

This isn't esoteric at all. It's only strange to people who have shut themselves off from consciousness and imagination.

The world is embroiled in the third tier: energy. That's where the great struggles are taking place. That's where people are trying to find enough energy.

Physical energy, enough energy to get through the day, biological energy, energy to power their homes, their cars, their devices, energy in the form called money, and of course we have the question of energy to run societies and civilizations.

For most people, at every level there is a deficit of energy. They feel it, they know it, they experience it.

It drives people into passivity and cynicism and illness and even madness.

And yet, we have potential access to enough energy to operate

the nations on this planet a million times over.

I'm talking about [Frank Shuman](#) and his original solar panels and engines, and [Tesla](#), of course, whose papers were stolen by the FBI upon his death, and so-called [cold fusion](#) which has proven to be much more promising than the fake pundits and fake scientists would have you believe.

I'm talking about the [Maine Passamaquoddy tidal energy project](#), which JFK promoted in vain for many years. As President he commissioned a report on it, and positive findings came in shortly before he was murdered. Passamaquoddy could be replicated all over the world, wherever there are coastal inlets with rapid shifting high and low tides.

I'm talking about small turbines in rivers all over the planet.

A tireless researcher named Andrea Silverthorne has pursued a deeper understanding of Passamaquoddy, and its connection to JFK, for a long time. You can find her article at dreamofpassamaquoddy.com [here](#).

I'm certainly talking about healing, too, because freedom from disease immediately restores energy to people. So this means more (suppressed) technologies: Royal Rife, for example, and his cancer-killing frequencies. And these days, the remarkable work of Dr. Stan Burzynski in Texas—surviving despite grand jury after grand jury mounted against him.

The point is, the means exist to multiply the amount of energy available to every human by extraordinary degrees.

It is precisely this state of potential abundance that the cartels and monopolies of Earth continue to repress. That is their Job One.

They live for that job.

They hire untold numbers of propagandists to smear and defame

sources of energy they don't own.

And humans, after a while, stop believing that abundance for all is possible. To cast that belief aside is a crushing blow. On a personal level, it makes people sink into a helpless state. It colors their experience, their frame of reference, their outlook, their emotions.

They give in, they surrender, they accept. They even come to believe that surrender is an advanced spiritual state.

But what's true is true. We do, in fact, have [\(suppressed\) technologies](#) that would, if unleashed, revolutionize this planetary civilization.

It isn't some deep mystery. It's all about who controls the future.

Look around you. Consider that every human you see is working to obtain more energy, in one way or another. It's endless.

And consider how much would change if these repressed technologies were deployed.
